1. AIM

To design and develop a responsive online hotel room booking website using HTML, CSS and JavaScript that allows users to register, search room availability, book and manage reservations, while administrators manage room inventory, bookings, users and website information.

2. SOURCE CODE

The project consists of three main files. Keep all three files in the same folder.

File	Purpose
index.html	Defines the website pages, navigation, forms, dialogs and screenshot-visible interface.
styles.css	Provides the layout, colours, room cards, responsive navigation, tables and mobile styling.
app.js	Implements registration/login, room search, availability, booking calculations, booking history, user restrictions, reviews and administrator operations.

2.1 HTML — index.html

```

3. PROCEDURE TO RUN

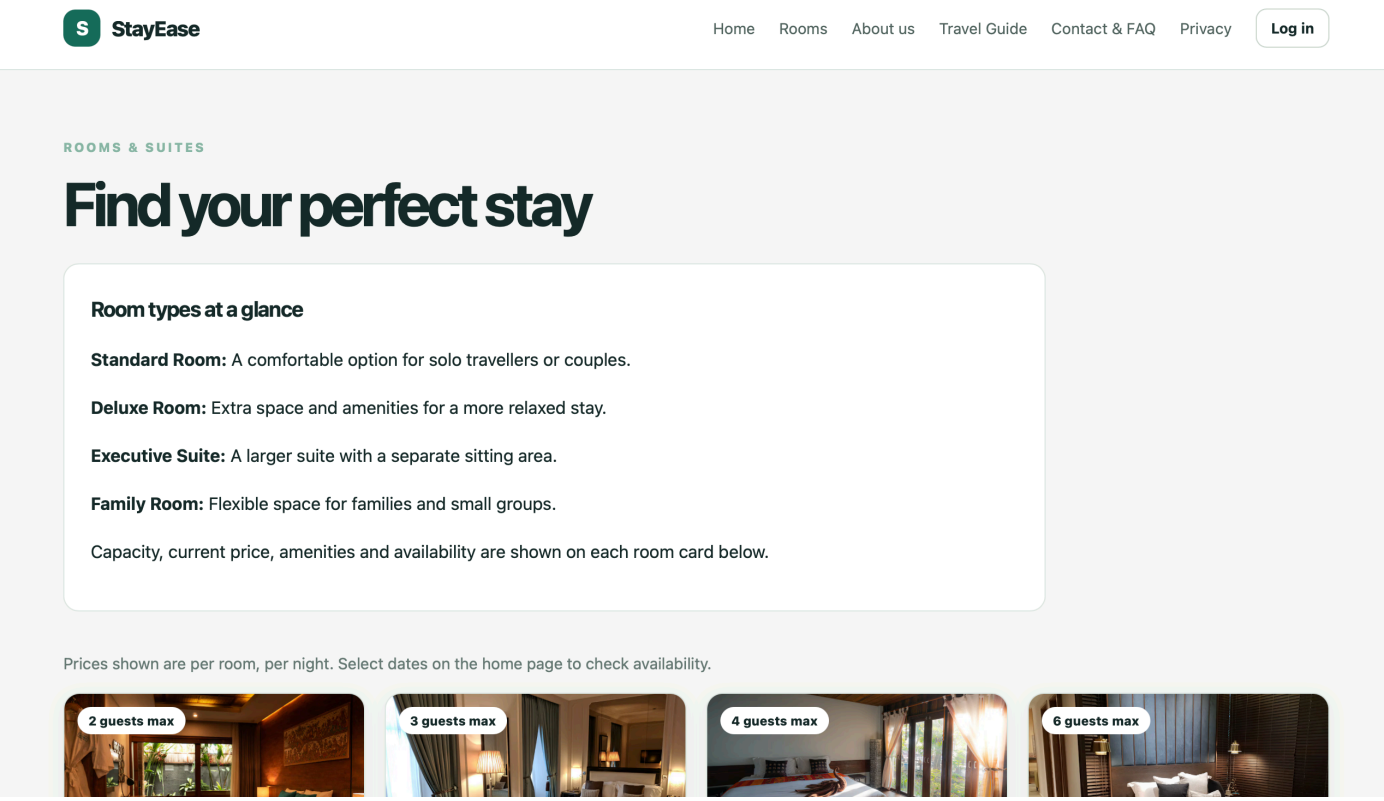

- Extract the project ZIP and keep index.html, styles.css and app.js in the same directory.
- Open index.html in a modern browser, or run `python3 -m http.server 8000` in the project folder and visit `http://localhost:8000`.
- Register a user account, search for rooms, select valid dates and create a booking.
- Open the dashboard to view booking history and test eligible modification/cancellation.
- Log in to the administrator panel to manage room prices, room quantities, bookings, users and static-page content.

4. OUTPUT SCREENSHOTS

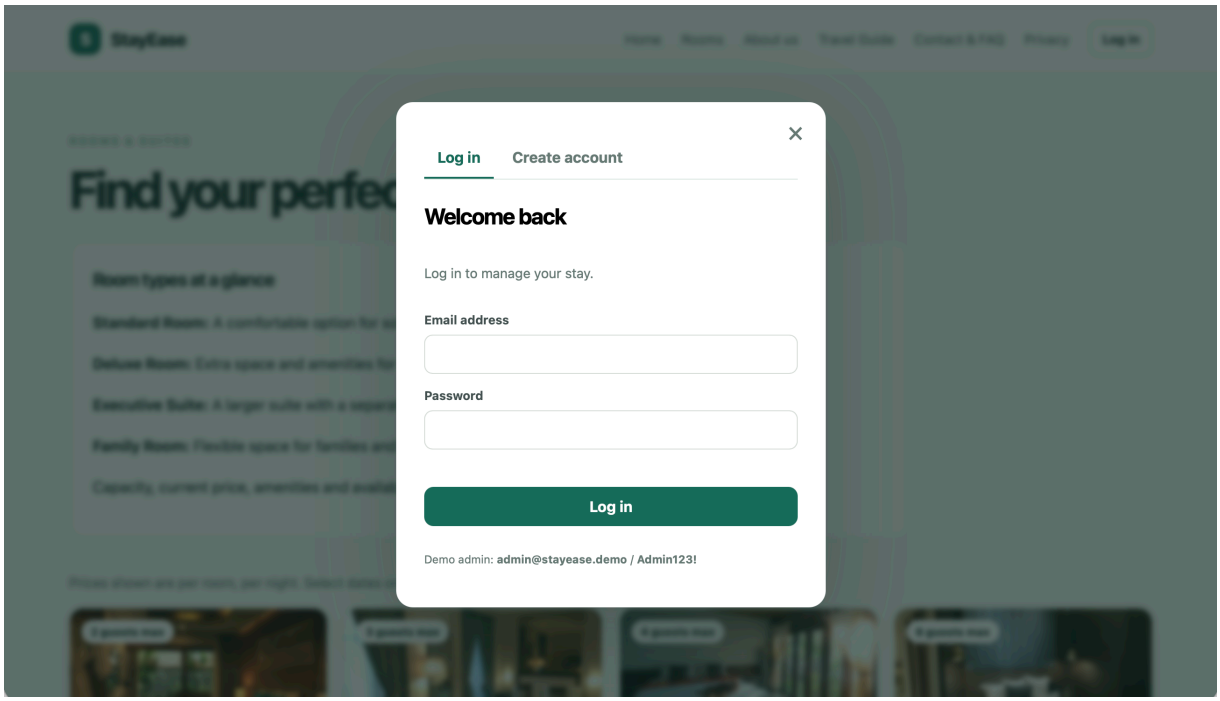

Home page

Room listing / availability

Registration / login

5. RESULT

The Online Hotel Room Booking Website was implemented using HTML, CSS and JavaScript. It demonstrates user registration and profile management, room search and availability checks, booking creation and history, the three-day user modification/cancellation rule, administrator inventory and booking management, reviews, and editable informational pages.
